Report:

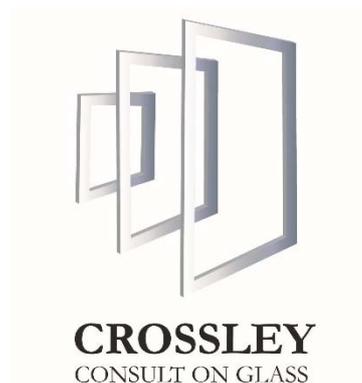

Deflection testing of the Barrier
SABCO modular balustrade
system.

2 INTRODUCTION

- 2.1 SADEV has designed and manufactured a modular balustrade system, which comprises of an aluminium base channel called Barrier SABCO (SADEV Balustrade Concept) for which they require witnessed line load testing. The Barrier SABCO aluminium base channels have previously been subjected to testing according to the French standards (CSTB).

In a number of other European countries including the United Kingdom, a code of practice; BS EN 6180:2011, Barriers in and about buildings- defines the requirements of a balustrade system that is used for the protection and guidance of persons. BS EN 6180:2011 defines the appropriate imposed loads and the performance limits loads such as a deflection limit of 25mm at the design level.

The Barrier SABCO system is available in 2 mount configurations, a floor mount and a side mount. Both configurations are to be subjected to line load testing.

- 2.2 The Barrier SABCO system is suitable for both monolithic and laminated glass ranging between 15 mm and 25.52mm.
- 2.3 The deflection tests were conducted at the premises of Kite Glass on 22nd and 23rd April 2015 under the supervision of Crossley Consult Ltd.

Graham Walker	Barrier Components Ltd.

3 METHOD

3.1 Glass Compositions

3.1.1 Eight glass panes of various sizes were tested.

1. 15mm monolithic clear toughened, 1000mm wide x 1200mm high
2. 16.9mm laminated toughened comprising two plies of 8mm toughened glass with a 0.89mm SentryGlas® interlayer, 1000mm wide x 1200mm high
3. 19mm monolithic clear toughened, 990mm wide x 1200mm high
4. 20.76mm laminated toughened comprising two plies 10mm toughened glass with a 0.76mm Solutia DG41 interlayer, 1000mm wide x 1200mm high

5. 20.9mm laminated toughened comprising two plies of 10mm toughened glass with a 0.89mm SentryGlas® interlayer, 1000mm wide x 1200mm high
6. 21.52mm laminated toughened comprising two plies of 10mm toughened glass with a 1.5mm polyvinyl butyral (PVB) interlayer, 1000mm wide x 1200mm high
7. 21.52mm laminated toughened comprising two plies of 10mm toughened glass with a 1.5mm EVA interlayer, 1200mm wide x 1360mm high
8. 24.9mm laminated toughened comprising two plies 12mm toughened glass with a 0.89mm SentryGlas® interlayer, 1000mm wide x 1200mm high

3.2 Apparatus

3.2.1 The Barrier SABCO floor mounting base channel and side mounting base channel were bolted onto a strong back test rig designed specifically for testing barriers under load using M10 G8.8 hex head bolts at 400mm centres (unless otherwise stated). The base channel is also capable of being bolted at 200mm centres if required. The strong back set up is shown in Figure 1 below, and a typical bolt fixing detail for the channels in Figure 2 below.

Page 4

Figure 1 Strongback prior to glass installation

Figure 2 typical bolt fixtures at 400mm centres.

3.2.2. Each glass sample was installed within the Barrier SABCO base channel with the appropriate number of clamps at 250 mm centres (4 for 990mm and 1000mm width, and 5 for 1200mm width) and fully secured (Figure 3). For the monolithic panes polypropylene shims were installed between the clamp and the glass as illustrated in Figure 4.

Page 5

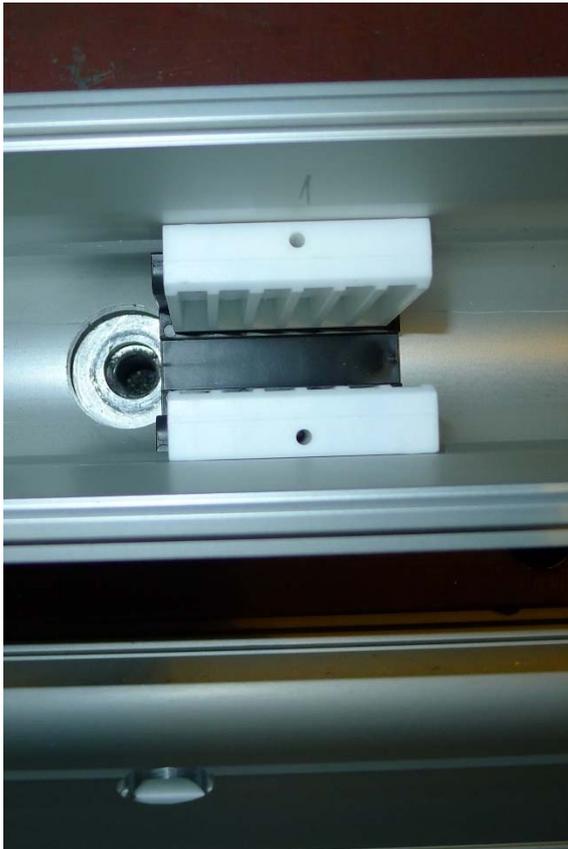

Figure 3 Typical lower section of clamp, an upper section is attached post glass installation to allow line and level to be set and the glass to be held firmly in place.

Figure 4 Shim for monolithic panels in situ, prior to fixing in position with the top section of the clamp.

3.2.3 The line load was applied using a small hydraulic piston attached to a spreader bar, and measured using a calibrated Mecmesin load cell with a digital read out. The height of the spreader bar was adjusted to 1100mm above finished floor level, and the load applied directly to the glass. The deflection of the glass was measured by individually mounted deflection gauges, a 50mm travel dial gauge reading in increments of 0.01mm at the design level (1100mm from FFL) and a 25mm travel dial gauge reading in increments of 0.01mm at the top of the base channel.

3.2.4 The upper travel gauge measured the overall deflection of the glass at design level, and the lower the deflection at the top of the base channel situated between clamps as shown in Figure 5 and Figure 6 below.

Figure 5 Upper dial gauge in situ

Figure 6 Lower dial gauge

3.3 Procedure

3.3.1 Three test loads were assessed, a line load of 0.74 kN/m run, a line load of 1.5 kN/m run and a line load of 3.0 kN/m run. In each case the load applied was appropriate to the requirements of BS EN 6180:2011.

3.3.2 BS 6180:2011 section 6.4.1 states that “for serviceability considerations, the limiting condition for deflection appropriate for a barrier for the protection of people is that the total horizontal displacement of the barrier at any point from its original unloaded position should not exceed the deflection limits determined from the relevant structural design code (where applicable) for the material used, or 25 mm, whichever is the smaller.” Whilst BS 6180:2011 section 8.5.1 states that for free-standing glass protective barriers “the glass should be designed to satisfy the appropriate design

criteria given in Clause 6. The deflection of the glass should be no greater than 25 mm at any point.”

3.3.3 For each load case and glass type, the following procedure was used:

- Install glass into the channel
- Manually pump the hydraulic jack until the load indicator shows the correct preload (equivalent to the correct load) and hold it for 60 seconds
- Remove the load
- Zero the load indicator
- Record a zero load deflection reading
- Manually pump the hydraulic jack until the load indicator shows the correct load (adjusted if necessary for the panel width).
- Immediately record the two deflection gauge readings.
- Record further deflection readings every 30 seconds after the first reading for a period of 5 minutes. Manually adjust the jack to maintain the correct load during this period.
- Remove the load.

3.3.4 Table 1 below shows the combinations of load and glass composition tested. For the 3.0 kN/m line load additional fixings were added to secure the base channel at 200mm centres.

Table 1 - Glass types and load combinations tested

	Floor Mount			Side Mount		
	0.74 kN/m	1.5 kN/m	3.0 kN/m	0.74 kN/m	1.5 kN/m	3.0 kN/m
15mm Monolithic	X			X		
16.9mm Laminated (SGP)	X	X		X		
19mm Monolithic		X		X	X	
20.76mm Laminated (DG41)		X			X	
20.9mm Laminated (SGP)		X			X	
21.52mm Laminated (PVB)	X	X		X		
21.52mm Laminated (EVA)	X	X		X	X	
24.9mm Laminated (SGP)			X			

4 RESULTS

- 4.1 Instantaneous deflection results were recorded, along with the creep over 5 minutes. Table 2 below indicates the instantaneous deflection results for the load and glass combinations tested. The values in yellow exceeded the permissible deflection limits. For the panels with an instantaneous deflection $\leq 25.00\text{mm}$ graphs illustrating the creep over 5 minutes can be found in Appendix 7.

Page 8

Table 2 - Instantaneous deflections

	Floor Mount			Side Mount		
	0.74 kN/m	1.5 kN/ m	3.0 kN/m	0.74 kN/m	1.5 kN/m	3.0 kN/m
15mm Monolithic	17.1			19.4		
16.9mm Laminated (SGP)	15.0	27.9		15.0		
19mm Monolithic		22.6		12.3	26.55	
20.76mm Laminated (DG41)		19.1			21.5	
20.9mm Laminated (SGP)		16.7			21.0	
21.52mm Laminated (PVB)	12.9	29.6		13.0		
21.52mm Laminated (EVA)	12.5	25.0		12.5	28.6	
24.9mm Laminated (SGP) (200mm centres)			28.3			

5 DISCUSSION

- 5.1 For each base configuration tested with a horizontal uniformly distributed load of up to 1.5 kN/m, applied at 1100mm from FFL, there are multiple glazing types which will fulfil the BS 6180:2011 instantaneous deflection performance requirement of under 25 mm.
- 5.2 None of the glazing types tested offered an instantaneous deflection of under 25 mm when subjected to a 3.0 kN/m horizontal line load.
- 5.3 Table 3, below summarises the tested solutions that achieved an instantaneous deflection below 25 mm in accordance with the BS 6180:2011 requirements.

Table 3 – Glass and load combinations with an instantaneous deflection within the BS6180:2011 standard of 25mm

	Floor Mount			Side Mount		
	0.74 kN/m	1.5 kN/m	3.0 kN/m	0.74 kN/m	1.5 kN/m	3.0 kN/m
15mm Monolithic	X			X		
16.9mm Laminated (SGP)	X			X		
19mm Monolithic		X		X		
20.76mm Laminated (DG41)		X			X	
20.9mm Laminated (SGP)		X			X	
21.52mm Laminated (PVB)	X			X		
21.52mm Laminated (EVA)	X	X		X		
24.9mm Laminated (SGP)						

6 REMARKS

- 6.1 The polypropylene shims installed with the monolithic panes exhibited mild distortion post-test, indicating that the polypropylene material is compressing and is not rigid enough to fully support the glass and that the deflection will continue to creep upwards for the duration of the applied load Figure 7. It is understood that these polypropylene shims are to be replaced by a different material.

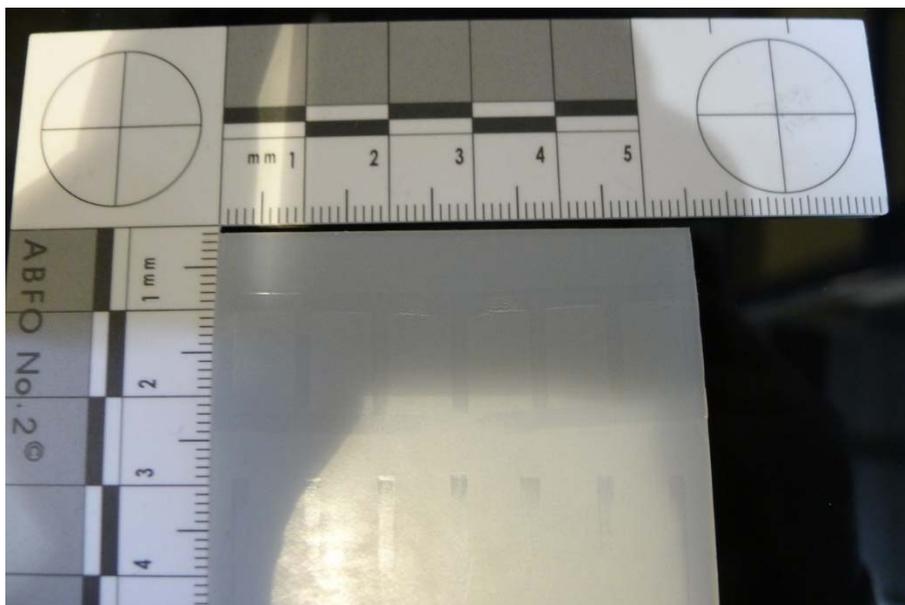

Figure 7 shim for monolithic post-test, showing mild distortion

- 6.2 The lower deflection measurements show a high level of consistency across the different glass and applied load combinations and minimal increase during the duration

of the applied load. The channel may deflect further in line with the base clamps where the load is being transmitted onto the channel structure; however this point was unable to be measured during testing.

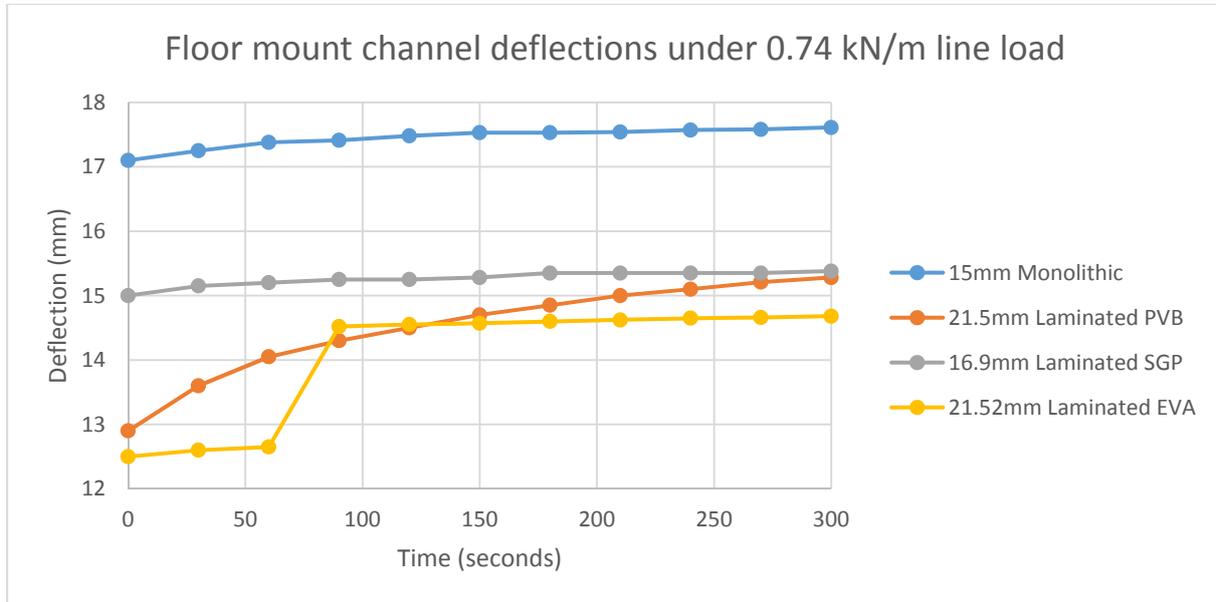

- 6.3 Under the 0.74 kN/m line load the top mounted 21.52mm EVA exhibited a significant jump in deflection between 60 seconds and 90 seconds. This jump corresponded with a drop in the applied load during the same time duration. This is believed to have been caused by the clamps settling into a new position and is not expected to occur should the combination be retested.
